Abstract

Community-based long-term care is the national social welfare development policy. Due to the impact of the epidemic in the past two years, each tribal community-based long-term care center has also undergone service changes. In the evaluation score table, the social work profession has three major indicators, which are the main projects of this research. The research adopts the content analysis and focus discussion method. During the research period, the service centers rated A and above in 2020-2021 will be collected.

Results: Under the epidemic, the key to achieving service indicators is staff resilience. The life of the service center has replaced the daily life mode of the elderly. A variety of “digital courses” have been developed. Also recommended: part of the working hour system can be imported, supplementary temporary staff at each center, exchanges and sharing information among neighboring tribes. Caregivers should also increase educational training in teaching skills.
